

EdgeVision — Live Demo Script

RETAILTRACK + FABRIC LENS · INTEL EVENT

~9-10 min demo
Live-first · clips as fallback
Pattern AI Labs

Read this as a runbook, not a script. **SHOW** = what's on screen · **SAY** = your line (paraphrase, don't recite) · **DO** = the action to take · **WATCH** = the thing the room should see happen. Go live-first; a recorded clip is the fallback for every step. Total demo ≈ 9-10 minutes.

BEFORE YOU START — PRE-FLIGHT CHECKLIST

- Edge appliance powered on and on the venue LAN; all demo cameras streaming (status green).
- RetailTrack + Fabric Lens consoles open in full-screen browser tabs; already logged in.
- One "VIP" profile pre-enrolled (a teammate/volunteer) for the recognition moment.
- Alert phone in hand or mirrored to the screen; ringer ON, WhatsApp/app logged in, battery full.
- Recorded backup clip saved locally for every step (in case a live feed drops).
- Screen mirroring / HDMI tested; laser pointer ready; you know which camera = which zone.
- Runs fully on-prem — no cloud needed. If the venue Wi-Fi is flaky, the demo still works.

PART A · RETAILTRACK — THE STORE FLOOR

≈ 4:35 LIVE

01 Live detection

0:45

- SHOW** Live store camera with overlays — STAFF (amber) and CUSTOMER (cyan) boxes on people.
- SAY** "This is an ordinary store camera — nothing special. EdgeVision is watching it live, on a small box inside the store. Every person is detected and classified — staff or customer — in real time. And notice: no faces are ever stored."
- DO** Point to a couple of boxes. Walk into frame yourself so a fresh detection pops up.
- WATCH** *A new box appears as you enter; the staff/customer count ticks up.*

02 One screen for the manager

0:45

- SHOW** The live operations console — footfall, active staff, alert stream, hourly-footfall chart.
- SAY** "Here's what the manager actually sees — one screen. Footfall today, how many staff are on the floor, live alerts, and the busy-hours curve. This is the morning huddle, on a screen."
- DO** Run a finger along the hourly chart; land on the peak.

03 Dwell heat-map

0:45

- SHOW** The dwell heat-map and top dwell zones (brand wall, centre table, entry...).
- SAY** "Where do customers actually spend time? The brand wall pulls the most dwell; the entry the least. Now you merchandise to real behaviour, not guesswork — and it's all computed on the in-store box."
- DO** Point to the hottest zone, then the coldest.

04 VIP recognition — the wow moment

1:15

- SHOW** Live feed. Your enrolled "VIP" volunteer is about to walk in.
- SAY** "Watch this. We've enrolled a loyalty customer. The moment they walk in..."
- DO** Cue the volunteer to enter. Within ~3 seconds the alert fires — hold up the phone.
- SHOW** Phone alert: name, tier, last visit, suggested next action.
- SAY** "...the manager's phone lights up — name, tier, last basket, and a recommended action. Matched entirely on the in-store box; no raw face ever leaves the building."
- WATCH** *The alert on the phone. If it lags, switch to the recorded clip and keep talking.*

05 Staff & live alerts

0:45

- SHOW** Alert stream: "wall unattended 2m", "queue > 4 at till 2", "back store > 4 staff".

SAY "The same cameras watch the team. A zone left unattended, a queue building, too many staff clustered in the back — the manager gets nudged, with a clip, while it still matters."

DO Trigger one live if you can (have 5 people form a queue), or walk the alert stream.

06 Recap

0:20

SAY "Same cameras. Two answers — the customer, and the team. On-prem, private, on one small Intel box."

PART B · FABRIC LENS — THE QSR LINE

≈ 4:05 LIVE

01 Live station: detection + classification

0:50

SHOW A counter / assembly camera. Boxes on items, with quality labels (present · right · low).

SAY "Same idea, in a restaurant. Fabric Lens watches the make-line. It doesn't just see a burger — it reads the build: which items are there, and whether they're right."

DO Point to one classified item and its confidence.

02 The intervention loop — the point

1:15

SHOW An order being assembled that is missing an item (e.g., a sauce the ticket calls for).

SAY "Here's what makes it different — it doesn't just detect, it intervenes. This order should have a sauce. It doesn't."

DO Show the alert fire to the assembly screen (audio chime at the pass).

SHOW Operator adds the sauce → it re-verifies → order released → event logged.

SAY "The operator is flagged before the bag ever leaves the counter. Fixed, re-verified, and logged for the audit trail — the whole loop in seconds."

WATCH *Alert → correction → the 'verified / released' state.*

03 Signal fusion — the moat

0:50

SHOW The fusion view: vision + equipment telemetry (fryer temp) + the order (KDS).

SAY "This is what no camera-only system has. The fryer reports 'done at temperature.' Vision reports the product is under-colored. Neither signal alone catches it — together, EdgeVision knows the equipment is drifting, not the cook."

DO Point to the two conflicting signals meeting in the fusion core.

04 The numbers that run the business

0:50

SHOW The dashboard — speed, order accuracy, food safety (rolling up to the P&L categories).

SAY "And it rolls up to what an operator actually runs on — speed, order accuracy, food safety — per shift, per station, ready for the next audit."

DO Point to the speed, accuracy and safety tiles.

05 Recap + hand back

0:20

SAY "Detection that counts is table stakes. EdgeVision understands — and acts. That's Fabric Lens."

IF IT BREAKS · RECOVERY

- A live feed drops → switch to that step's recorded clip and narrate the same lines. Don't debug live.
- Console is slow → use the saved screenshot walkthrough; the story is the same.
- One sentence covers any hiccup: "We run fully on-prem, so this is just our venue network." Then move on.
- Keep the phone awake and the alert sound on for the VIP and intervention moments.

LIKELY QUESTIONS — QUICK ANSWERS

Privacy / faces

False alerts

Nothing leaves the store — no biometrics, no video sent anywhere. Matching is on the box; retention is FIFO and you configure it.

Our cameras / IT

Uses your existing IP cameras over RTSP. One small Intel appliance on the LAN. No cloud dependency — it works offline.

Time to value

A focused 3-week pilot in one location — live results on your own floor by week 3.

Scene-aware GenAI with thresholds you tune per site. Every alert comes with a clip, so a human confirms.

Integration

REST APIs, webhooks and WhatsApp. Connects to POS / KDS and your BI stack.
