

EdgeVision — Demo Script

FABRIC LENS · LIVE SOFTWARE WALKTHROUGH · INTEL EVENT

~5 min walkthrough
Show it · tell the story
Pattern AI Labs

Three cues per step — **SHOW** what's on the screen, **SAY** it in your own words, **POINT** to what matters. Learn the ideas, not the exact wording. Speak slowly, and give each screen a moment to land before you move on. The whole walkthrough is about 5 minutes.

BEFORE YOU START

- Laptop connected to the projector; screen mirrored and tested. Sound ON — the alerts have a chime.
- Fabric Lens open and full-screen. Know the tabs: Live Wall · Ops Board · Inventory · Insights · Alerts.
- Each part of the walkthrough is queued in order. Know which screen comes next before you start.
- Close every other tab and notification. Nothing should pop up while you present.
- Keep this sheet where you can see it. You tell the story; the screen shows the proof.
- Open with one line: "This is our software running live on an ordinary quick-service kitchen."

THE WALKTHROUGH

≈ 5:25

01 The whole restaurant on one screen

0:30

- SHOW** The Live Wall — every camera at once: the make-line stations, the fryer, the storeroom shelves, and the back door.
- SAY** "This is the whole restaurant on one screen — the front line, the fryer, the storeroom, even the delivery door. One system watches all of it, live. Everything I show next is happening on these same cameras."
- POINT** *Point out a make-line station, the fryer, and the storeroom shelves.*

02 Station 1 — is the order right?

1:00

- SHOW** Station 1, looking down at the box. It reads the ticket (a Box Combo) and checks every item. A red line appears: "Drop a slice of Texas toast in the box."
- SAY** "Station one checks the order before it's bagged. The camera reads the ticket and counts what's actually in the box — and it's caught a missing Texas toast. The screen tells the team exactly what to add."
- POINT** *Point to the alert line, then to the ticket checklist on the right.*
- SHOW** The toast goes in; the team taps Re-check; the panel turns green — "Order complete · Ready, bag it."
- SAY** "They add it, re-check, and it clears to green. A wrong order fixed before it ever left the counter."

03 Station 2 — is it cooked right?

0:45

- SHOW** Station 2, two cooked tenders side by side, graded against the ideal. Batch score 95%. One is flagged: "Pull the over-fried tender, drop a fresh one."
- SAY** "Station two grades how the food is cooked. It compares each piece to the ideal — colour, size, how well it's fried. Here it's spotted one that's over-fried and says: pull it, drop a fresh one. That's quality no busy line can watch by eye."
- POINT** *Point to the two tenders and the batch score.*

04 Station 3 — was it built in the right order?

0:45

- SHOW** Station 3, the build shown as a strip of steps. A step is missing: "Add sauce to the order before bag." The item is tagged "without sauce."
- SAY** "Station three watches how the food is built, step by step. This order was about to be bagged without its sauce — the system catches it and asks for it before the bag closes. When it's right, it shows 'SOP compliant.'"
- POINT** *Point to the step strip, then the 'add sauce' flag.*

05 Ops Board — every order, scored live

0:50

- SHOW** Operations, Store #1234. A live list — every ticket, its channel (drive-thru, dine-in, mobile) and a score for order accuracy, quality and prep. Along the top: throughput 41/hr, average order time 2m 47s, fryer oil 342°F, 14 open alerts.
- SAY** “Everything rolls up here — every order, from every channel, scored as it happens. Green is clean, red needs a look. The manager sees the whole shift on one screen — even the fryer temperature and how long orders are taking.”
- POINT** *Run your finger down the ticket list; stop on a red ‘re-check’ row.*

06 The back of house, too

0:40

- SHOW** Inventory — the storeroom shelves tracking stock (crinkle fries, tenders), the fryer, and the receiving door as deliveries arrive.
- SAY** “It’s not just the front line. The same system watches the storeroom and the back door — what’s on the shelf, what’s running low, and what’s just been delivered. One platform, front to back.”
- POINT** *Point to a tracked box on the shelf, then the receiving-door camera.*

07 The numbers that add up

0:35

- SHOW** Insights and Alerts — the shift’s key numbers (accuracy, speed, food safety, waste) and a live list of what needs attention.
- SAY** “And it adds up to the numbers a manager and an owner actually use — accuracy, speed, food safety, waste — with a live list of what needs a look. Ready for the next audit, with nobody filling in a clipboard.”
- POINT** *Point to one number, then the alert list.*

08 Recap

0:20

- SAY** “Same cameras, the whole restaurant. It doesn’t just watch — it catches the missing toast, the over-fried tender, the forgotten sauce, and fixes them before the customer ever sees. That’s Fabric Lens.”

HOW TO CLOSE

- Bring it home: “It runs on your existing kitchen cameras, on a small box on-site. Nothing goes to the cloud.”
- The ask: “Give us three weeks in one of your restaurants and we’ll show you these same results on your own line.”
- Then pause and take questions — the quick answers are below.

IF SOMEONE ASKS — SIMPLE ANSWERS

Is this scoring our staff?

It scores the food and the order, not the person. No faces are stored, and nothing leaves the store — it all runs on the box on-site.

Does it need new cameras?

No — it uses the kitchen cameras you already have. Just one small box added on-site.

How does it fit our systems?

It connects to your order screens (POS / kitchen display) and can send alerts to a screen or a phone.

Won’t it cry wolf?

Every alert comes with the picture, so a person can glance and confirm. You set how strict each station is.

Does it need the internet?

No. It keeps working even if the internet goes down, because everything runs locally.

How soon do we see results?

A three-week trial in one restaurant — real results on your own line by week three.
