

# EdgeVision — Demo Script

RETAILTRACK + FABRIC LENS · INTEL EVENT

~8-9 min · recorded videos

Play the clip · tell the story

Pattern AI Labs

Everything in this demo is a **pre-recorded video** — you play each clip and tell the story over it. Three simple cues per step:

**PLAY** = the clip to play · **SAY** = your words, in plain language (paraphrase, don't read it out) · **POINT** = what to point at on screen. Whole demo is about 8-9 minutes. Speak slowly, let the video breathe.

## BEFORE YOU START

- Laptop connected to the projector; screen mirrored and tested. Sound ON — a couple of clips have an alert chime.
- All demo videos open and lined up in order, full-screen. Know which clip is next before you start.
- Close every other tab and notification. Nothing should pop up mid-demo.
- Have the running order on this sheet where you can see it. You are telling a story, the video is the proof.
- One line to open with: "Everything you're about to see is our software running on real store and restaurant cameras."

## PART A · RETAILTRACK — THE STORE FLOOR

≈ 4:20

### 01 People, seen clearly

0:45

**PLAY** Store-floor clip — coloured boxes follow each person; STAFF in amber, CUSTOMER in cyan.

**SAY** "This is a normal store camera. Our software is watching it and marking every person — amber is your staff, cyan is a customer. It does this by itself, and it never saves anyone's face."

**POINT** *Point at one amber box and one cyan box as they move.*

### 02 One screen for the manager

0:45

**PLAY** The manager dashboard — footfall today, staff on the floor, live alerts, a busy-hours chart.

**SAY** "This is the only screen a store manager needs. How many people came in today, how many staff are on the floor, what needs attention right now, and the busy hours. Everything on one page."

**POINT** *Trace the busy-hours curve with your finger and stop on the peak.*

### 03 Where people spend time

0:45

**PLAY** The heat-map clip — hot zones glow; a list shows the top areas (brand wall, centre table, entry).

**SAY** "The red areas are where customers actually stop and spend time. Here, the brand wall pulls the most; the entrance the least. Now you can place your best products where people really go — not where you guessed."

**POINT** *Point to the hottest area, then the coldest.*

### 04 Spotting your best customer

1:00

**PLAY** The recognition clip — a loyalty customer walks in; a phone alert pops up with name, tier, last visit.

**SAY** "Watch the phone. A loyalty customer just walked in — and the manager's phone tells them who it is, their level, when they last came, and what to offer. Now the customer gets a warm welcome instead of walking past unnoticed."

**POINT** *When the alert appears, point to it: "name, level, last visit." All worked out inside the store — nothing sent outside.*

### 05 Small problems, caught early

0:45

**PLAY** The alerts clip — messages appear: "section left unattended", "queue building at till 2", "too many staff in the back".

**SAY** "The same cameras also watch the shop floor for you. A section with no staff, a queue building up, too many people standing in the back room — the manager gets a quiet nudge while there's still time to fix it."

**POINT** *Read out one or two alerts as they appear.*

## 06 Quick recap

0:20

**SAY** "Same cameras, two jobs — help the customer, and help your team. All of it runs on one small box inside the store. Nothing leaves the building."

## PART B • FABRIC LENS — THE RESTAURANT LINE

≈ 3:55

### 01 Reading the kitchen line

0:50

**PLAY** Make-line clip — boxes on each item, with a simple label (there / correct / not right).

**SAY** "Same idea, now in a restaurant. Our software watches the counter where food is made. It doesn't just see a burger — it checks the build: is every item there, and is it right?"

**POINT** *Point to one item and its label.*

### 02 It catches the mistake — and fixes it

1:10

**PLAY** Clip: an order is missing an item; an alert pops up on the kitchen screen with a chime; the item is added and the order clears.

**SAY** "This is the important part. This order is missing a sauce. The screen flags it right away — before the bag goes out. The staff add it, the software double-checks, and the order is cleared. A wrong order caught in seconds, not after the customer complains."

**POINT** *Follow it on screen: the alert, then the green 'all correct' once it's fixed.*

### 03 Two signals are better than one

0:50

**PLAY** Fusion clip — the camera view next to the fryer reading and the order screen.

**SAY** "Here's something a camera alone can't do. The fryer says the food is cooked. The camera says it still looks pale. Put those two together and you learn the fryer is running cool — a problem you'd never catch by eye until customers noticed."

**POINT** *Point to the two readings that disagree.*

### 04 The numbers a manager cares about

0:45

**PLAY** The dashboard — service speed, order accuracy, food-safety checks, by shift and station.

**SAY** "And it all adds up to the numbers an owner actually runs on — how fast service is, how accurate orders are, and food-safety checks — for every shift and every station, ready for the next audit."

**POINT** *Point to the speed, accuracy and safety tiles.*

### 05 Recap + hand back

0:20

**SAY** "Counting things is easy. The difference here is it understands what's happening — and speaks up in time to fix it. That's Fabric Lens."

## HOW TO CLOSE

- Bring it home: "Two products, one platform. It runs on your existing cameras, on a small box on-site. Nothing goes to the cloud."
- The ask: "Give us three weeks in one of your stores and we'll show you these same results on your own floor."
- Then pause and take questions — the quick answers are below.

## IF SOMEONE ASKS — SIMPLE ANSWERS

### Is this recording faces?

No faces are saved and no video leaves the site. Everything is worked out on the box inside your store.

### Won't it cry wolf?

Every alert comes with a short clip so a person can glance and confirm. You set how sensitive it is, per site.

### Does it need new cameras?

### Does it need the internet?

No — it uses the cameras you already have. Just one small box added on-site.

---

**How does it fit our systems?**

It plugs into your billing / kitchen screens and can send alerts to a phone or WhatsApp.

---

No. It keeps working even if the internet goes down, because everything runs locally.

---

**How soon do we see results?**

A three-week trial in one location — real results on your own floor by week three.

---
